「Modeling event times with applications to health care outcomes」

Speaker : Elizabeth Juarez-Colunga

(Department of Biostatistics and Informatics, Colorado School of Public Health,
University of Colorado Anschutz Medical Campus)

Abstract : Modeling event-time data poses challenges in several situations; for instance, when events may recur over time or when multiple outcomes of interest are recorded. Modeling timing of events is relevant across many fields, including the natural sciences, social sciences and medicine. In this talk, I will provide a brief introduction to several extensions of time-to-event analysis and discuss their applications in the context of health care outcomes. Examples will include modeling recurrent epileptic seizures using a self-exciting process and modeling quality of life backwards from death in palliative care studies.
